STM Nucleo L476RG Morpho Connectors for the MCU Eval Board.

These connectors are the mounts for the STM Nucleo L476RG MCU Eval Board.
The Nucleo Board is the processor which holds the state machine, controls the valves, and will read the physical valve positions.

All Resistors and Capacitors are 0805, unless otherwise noted.

Sheet: 1/4

This is the 24V Battery which only supplies power to the valves and is controlled by STM GPIO pins.
This battery is controlled by the 12V poe trigger to a solenoid relay.

These circuits are for controlling the 9 valves and 1 ignitor on the Test Stand.
They are triggered by STM GPIOs and powered by the 24V Test Stand Battery

All Resistors and Capacitors are 0603 or 0805

24V input, 12V output voltage regulator for SOV-4 (SOV-F04), the only valve that runs at 12V.
